DETAILED ACTION

1. Claims 25-35, 37-57 and 59-68 are presented for further examination.

EXAMINER'S AMENDMENT

2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Kevin Morgan on April 13, 2005.

The application has been amended as follows:

In the claims:

Claims 35 and 45, line 1, delete "step (d)" and replace with -- step (e) --.

Claim 41, delete "38" and replace with -- 40 --.

Claim 40, delete "38" and replace with -- 39 --.

Claim 63, delete "60" and replace with -- 62 --.

Claim 62, delete "60" and replace with -- 61 --.

Allowable Subject Matter

3. Claims 25-35, 37-57 and 59-68 are allowed.

As per independent claims 25 and 46, the prior art of record fails to teach a method for assisting a person in controlling one or more devices, wherein a vibration sensor is attached either to a person's head or over a bony mastoid process, wherein when the person clicks his or her upper and lower teeth together, a control signal is formed that allows for stimulating movement of the person's body part, in combination with the other claimed features.

The closest available art appears to be US Patent Application Publication No. 2003/0120183 A1, filed by Simmons, in which assistive clothing is disclosed that utilizes mouth controls to operate a person's body parts. Simmons, however, does not teach the use of clicking upper and lower teeth together since Simmons discloses utilizing the person's tongue to cause actuation of the sensors located along the teeth. Simmons does not teach a microphone used to pick up signals emanating from the clicking of the upper and lower teeth.

The next closest prior art was issued to Yoshizawa et al., U.S. Patent No. 4,392,244, in which a device is disclosed that utilizes a person's clicking of their upper and lower teeth in order to effectuate a switch between an "off" and "on" state of a communication device. Although Yoshizawa et al. teaches clicking upper and lower teeth for creating a control signal, Yoshizawa et al is not directed towards moving a person's body part.
